TABLE OF CONTENTS

- 1.01 Summary
- 1.02 References
- 1.03 Submittals
- 1.04 Qualifications
- 1.05 Packaging
- 1.06 On – Site Conditions
- 1.07 Material Warranty
- 1.08 Fabricated Seam Warranty
- 1.09 Geomembrane Installation Warranty
- 1.10 Geomembrane Pre-construction Meeting
- 2.01 Source Quality Control
- 3.01 Subgrade Preparation
- 3.02 Geomembrane Placement
- 3.03 Seaming Procedures
- 3.04 Seaming Specifications
- 3.05 Pipes and Structure Penetration Sealing System
- 3.06 Field Quality Control
 - A. Prequalification Test Seams
 - B. Non-Destructive Field Seam Testing
 - C. Destructive Field Seam Testing
 - D. Identification of Defects
 - E. Evaluation of Defects
 - F. Verification of Repairs on Seams
 - G. Daily Field Installation Reports
- 3.07 Liner Acceptance
- 3.08 Anchor Trench
- 3.09 Backfilling and Covering the Geomembrane
- 3.10 Disposal of scrap materials
- 4.01 Measurement and Payment
- 5.01 PGI 1104 Specification

1.01 Summary

- A. Specification includes fabrication and installation of PVC geomembranes in accordance with PVC Geomembrane Institute (PGI) requirements.

1.02 References

ASTM D4437, “*Standard Practice for Determining the Integrity of Field Seams Used in Joining Flexible Polymeric Sheet Geomembranes*”, American Society for Testing and Materials, West Conshohocken, Pennsylvania, USA.

ASTM D6214, “*Standard test method for determining the integrity of field seams used in joining geomembranes by chemical fusion methods*”, American Society for Testing and Materials, West Conshohocken, Pennsylvania, USA

ASTM D6392, “*Standard test method for determining the integrity of nonreinforced geomembrane seams produced using thermo-fusion methods*”, American Society for Testing and Materials, West Conshohocken, Pennsylvania, USA

ASTM D7177, “*Standard test method for air-channel testing of field PVC Geomembrane Seams*”, American Society for Testing and Materials, West Conshohocken, Pennsylvania, USA

PVC Geomembrane Institute (PGI), 2004, “PVC Geomembrane Material Specification 1104”, University of Illinois, Urbana, IL, www.pvcgeomembrane.com, January 1, 2004.

1.03 Submittals

- A. Submit under provisions of Section 1.03, Submittals.
- B. Submit the following to the Engineer or Owner, for review and approval, within a reasonable time so as to expedite shipment, fabrication, and installation of the PVC Geomembrane.
 - 1. Documentation of the manufacturers qualifications as specified in subsection 1.04(A) of this specification.
 - 2. Manufacturers quality control program manual.
 - 3. A sample property sheet, including at a minimum all properties specified, including test method used.
 - 4. Sample of material.
 - 5. Documentation of fabricator and installers experience, as specified in subsection 1.04(B) and 1.04(C) of this specification.

- a. Submit a list of ten completed facilities. For each installation provide: name and type of facility; its location; the date of installation; name and telephone number of contact at the facility familiar with the geomembrane installation; type and thickness of geomembrane, type of field seaming, and surface area of installed geomembrane.
- b. Submit resumes or qualifications of fabrication manager.
- c. Fabrication quality control program.
- d. Installation quality control program.
- e. Example of Material Warranty and Fabricated Seam Warranty.
- f. Copy of Manufacturers and Fabricator's quality control program.

C. Shop drawings

1. Submit copies of shop drawings within a reasonable time so as not to delay the start of material fabrication and installation.
2. Shop drawings shall show the proposed panel layout identifying seams and details. Wherever possible, field seams should be oriented along the direction of the slope.
3. Placement of geomembrane shall not be allowed until approval has been received from the engineer or owner.

D. Additional submittals (in progress and at completion)

1. Manufacturers warranty (refer to Section 1.07).
2. Fabricated seam warranty – 1 Year.
3. Field seam warranty – 1 Year.
4. Installation warranty – 1 Year.
5. Daily written acceptance of subgrade
6. Low temperature deployment and seaming process
7. Daily field weld test results
8. Field seam destructive test results
9. Field repair/patching of defects
10. Daily field installation reports
11. As-built drawings

1.04 Qualifications

- A. Manufacturers qualifications: The manufacturer of the PVC geomembrane of the type specified shall have at least five years of experience in the manufacture of PVC geomembranes. In addition, the geomembrane manufacturer shall have manufactured at least one million square feet of the specified type of geomembrane in the last five years and be a member of the PVC Geomembrane Institute (PGI).

- B. Fabricators qualifications: The Fabricator of the proposed PVC geomembrane shall have a minimum five million square feet of fabrication experience over the last 3 years and be a member of the PGI.
- C. Installer qualifications: The Geomembrane Installer shall have at least three years of experience in the installation of the specified geomembrane and shall have installed a minimum of five million square feet of the specified geomembrane on a minimum of ten projects. The installer shall be certified by the fabricator to install fabricated products and be a member of the PGI.
 - 1. Installation shall be performed under the direction of a Field Installation Supervisor who shall be responsible throughout the geomembrane installation. Responsibilities include: geomembrane panel deployment, anchorage, seaming, patching, testing, repairs, and all other daily activities of the Geomembrane Installer.
 - 2. Seaming shall be performed under the direction of a Master Seamer (who may also be the Field Installation Supervisor or Crew Foreman) who has seamed a minimum of three million square feet of the type specified, using the same type of seaming apparatus to be used in the current project. The Field Installation Supervisor or Master Seamer shall be present whenever field seaming is being performed.
 - 3. All seaming, patching, other welding operations, and testing shall be performed by a qualified technician employed by the Geomembrane Installer.

1.05 Packaging

- A. Each fabricated panel delivered to the site shall be wrapped with protective material and labeled by the fabricator. The label or marking shall have manufacturers name, material thickness, panel identification number corresponding to panel placement layout, panel dimensions, weight, and be labeled on fabricated material as well as protective cover.
- B. Panels shall be stored on a clean, level, dry area away from high traffic.

1.06 On – Site Conditions

- A. No standing water, mud, snow, or excessive moisture will be allowed on the site. The Geomembrane will not be deployed in the presence of standing water, mud, snow, or frozen subgrade conditions. Geomembrane should not be installed while precipitation is occurring or during excessive winds, or

when temperatures are outside the limits specified in section 3.03 of this specification.

1.07 PVC Geomembrane Material Warranty

As required by specification.

1.08 Factory and Field Fabricated Seam Warranty

A. The Fabricator and Installer shall warrant factory and field fabricated seams, respectively, for a period of one (1) year after installation against defects in workmanship.

1.09 Geomembrane Installation Warranty

A. The Geomembrane Installer shall guarantee against defect in the installation and workmanship for a period of one (1) year commencing with the date of final acceptance.

1.10 Geomembrane Pre-construction Meeting

A. A geomembrane Pre-Construction meeting shall be held at the site prior to installation of the PVC geomembrane. At a minimum this meeting should be attended by the Geomembrane Installer, Owner, Owner's Representative (Engineer or CQA Firm), and the Earthwork Contractor.

B. Meeting topics should include the following:

1. Responsibilities of each party.
2. Lines of authority and communication for the project. Procedures for resolution of any project document ambiguity.
3. Methods for documenting, reporting, and distributing documents and reports.
4. Procedures for packaging and storing archive samples.
5. Review of the time schedule for all installation and testing. Schedule of workdays and/or starting times if third party testing verification is required.
6. Review of panel layout, access, numbering systems for panels, deployment, and seams including details for marking on the PVC geomembrane.

7. Procedures and responsibilities for preparation and submission of as-built drawings.
8. Temperature and weather limitations. Installation procedures for adverse weather conditions. Defining acceptable subgrade or ambient moisture and temperature conditions for working during liner installation.
9. Subgrade conditions, dewatering responsibilities, and subgrade maintenance plan.
10. Deployment techniques including allowable subgrade condition for geomembrane placement.
11. Anchor trench construction, material placement, and backfilling.
12. Plan for minimizing and addressing wrinkles, if any, in the placed geomembrane.
13. Measurement and payment schedules.
14. Covering of the Geomembrane and cover soil placement.
15. Health and safety.

2.01 Source Quality Control

Geomembrane

- A. The geomembrane shall consist of new, virgin materials and be manufactured specifically for this work and will have satisfactorily demonstrated by prior testing to be suitable and durable for such purposes. The geomembrane shall be manufactured and fabricated by a member of the PGI and to the PGI 1104 specifications.

3.01 Subgrade Preparation

- A. The subgrade shall be prepared in accordance with the project specifications. Surfaces to be lined will be smooth and free of all rocks and stones greater than 1/2" diameter, sticks, sharp objects, or debris of any kind. The surface should provide a smooth, flat, firm, unyielding foundation for the geomembrane with no sudden, sharp, or abrupt changes or break in grade.
- B. The stability of PVC geomembrane slopes should be carefully evaluated because the maximum allowable slope depends on the characteristics of the materials underlying and overlying the PVC geomembrane as well as other factors such as rainfall and gas pressure. However, maximum slopes less than 3 horizontal to 1 vertical have been observed to be stable in some applications.
- C. If the liner is to be installed at an elevation below the current or possible future ground water elevation, the OWNER will be responsible for providing

- an adequate underdrain system to prevent ground water pressure from developing beneath the geomembrane. Excessive ground water can force the geomembrane upwards through the cover soil and any liquid contained in the impoundment.
- D. The geomembrane installer and the owner's representative shall inspect the subgrade surface to be covered with geomembrane on each day's operation prior to placing the geomembrane to verify suitability.
 - E. The Geomembrane installer and Owner's Representative shall provide daily written acceptance for the subgrade surface to be covered in that day's operation. The surface shall be maintained in a manner to ensure subgrade suitability.
 - F. All subgrade damaged by construction equipment and deemed unsuitable for geomembrane deployment shall be repaired prior to placement of the geomembrane. All repairs shall be approved by the owner's representative. The responsibility for preparation, repairs, and maintenance of the subgrade shall be defined in the preconstruction meeting.

3.02 Geomembrane Placement

- A. PVC geomembrane shall not be deployed until all applicable submittals, certifications, and quality control certificates listed in subsection 1.03 of this specification are submitted and approved by the owner's representative. Should the PVC geomembrane be deployed prior to approval of the Owner's Representative, it will be at the sole risk of the geomembrane installer and/or contractor. If the material does not meet the specification it shall be removed from the site at no cost to the owner.
- B. The PVC geomembrane shall be installed to the project limits as detailed on the panel layout drawings.
- C. Temperature limitations shall be determined in the preconstruction meeting and approved by the Owner's Representative unless otherwise approved by the owner.
- D. No vehicles, other than those approved by the installer, are allowed on the geomembrane. Small rubber tired equipment with a ground pressure not exceeding 5 psi and a total weight not exceeding 750 lbs will normally be allowed. Typical equipment that is usually used during installation and testing and allowed on the geomembrane include air compressors, generators, etc.

- E. Sandbags or equivalent ballast shall be used as necessary to temporarily hold the PVC geomembrane in position.
- F. Geomembrane placement shall not be performed if moisture present prevents proper subgrade preparation, panel placement, or panel seaming. Moisture limitations shall be defined in the preconstruction meeting.
- G. Damaged panels or portions of damaged panels which have been rejected shall be marked and their removal from the work area recorded.
- H. The geomembrane shall not be allowed to "bridgeover" voids or low areas in the subgrade. In these areas the PVC geomembrane shall be installed with sufficient slack as to allow material to remain in intimate contact with the subgrade or the subgrade repaired.
- I. In general, seams shall be oriented parallel to the line of the maximum slope, i.e., the seam should run down the slope. In corners and odd geometric locations, the total length of the field seam shall be minimized. If at all possible, seams shall not be located at low points in the subgrade unless geometry requires seaming to be done at these locations.
- J. Panel Overlapping for Seaming:
 - Chemical Seam – 6-8" overlap with a 2" wide seam.
 - Thermal Seams:
 - Single Track weld – 4 to 6" overlap and a minimum 1.5" wide seam.
 - Dual Track weld – 4 to 6" overlap and minimum 0.5" wide seams

3.03 Seaming Procedures

- A. Cold weather seaming procedures may include the following.
 - 1. Storage of fabricated product in a heated space prior to deployment.
 - 2. Applying preheat immediately in front of area to be welded.
 - 3. QA/QC testing should include additional test welds to determine if field seams can be created to meet the PGI 1104 requirements.
 - 4. The Owners representative shall approve the cold weather procedures and be available to verify that seam quality parameters can be achieved.
- B. High temperature seaming procedures may include the following:

1. Suspension of work if temperatures create a dangerous work environment for the installation crew and inspectors.
 2. Preparation of additional qualification strips to determine if welding can be completed and made to meet PGI 1104 seam strength requirements.
- C. Fishmouths shall be kept to a minimum and when necessary be cut out and repaired so as to create a flat overlap.
- D. All repairs shall extend a minimum of 6" past any cut in all directions. Thus, a circular patch will have a diameter of at twelve inches, i.e., a radius of six inches, for a small hole.

3.04 Seaming Specifications

1. Chemical Seaming
 - A. Prior to starting any field welds each seam crew shall prepare a test seam to verify quality and temperature requirements can be met.
 - B. Panels to be welded using chemicals shall be overlapped a minimum of 6".
 - C. Care should be taken to clean all areas with a rag prior to applying chemicals.
 - D. A sufficient amount of chemical shall be placed on both sheets of the PVC geomembrane to be joined with either a squeeze bottle or paintbrush and form a continuous wide weld path of at least 1.5 inches in width.
 - E. After application of chemical, the seam area should be rolled with a seam roller releasing any air bubbles and forming a continuous seam path. The seaming crew shall take care to always tie-in or weld to the prior chemical seam area as they continue along down the seam.
 - F. Upon completion of each seam, the seam shall be inspected and any loose areas re-rolled and/or chemical added as required to complete the seam.
2. Thermal Welding Specifications
 - A. Each Master Seamer shall complete a trial weld of 5' long and each sample shall be tested in accordance with the PGI 1104 Specification in Section 5.01.

- B. Panels to be seamed together by a thermal weld shall be overlapped 4" to 6".
- C. Panels shall be wiped clean removing dirt and dust prior to seaming. This can be facilitated with the use of hot air welders that blow dirt and dust from the seam area.
- D. Panels should be positioned and all wrinkles pulled out of the seam area prior to seaming.
- E. Master Seamer shall walk with welder at all times and continually check overlap, temperature, and weld quality.
- F. Destructive seam samples shall be pulled at intervals as directed by the Owners Representative or at a minimum of one per 500 lineal feet of thermally welded seam when Air Lance Testing using ASTM D4437 is performed. When Air Channel Testing is performed on the thermally welded seam in accordance with ASTM D7177, no destructive samples will be taken from the production liner. However, destructive samples will be obtained from test welds and/or welds in the anchor trench at the beginning and end of each day.
- G. If destructive sampling is specified, both sides of the weld shall be tested for shear and peel strength sample in accordance with ASTM D6392.
- H. Samples shall be tested and evaluated in accordance with the PGI 1104 Specification in Section 5.01.

3.05 Pipes and Structure Penetration Sealing System

- A. Provide penetration sealing system as shown on the Project Drawings.
- B. Penetrations shall be sealed using the same PVC geomembrane material, flat stock, prefabricated boots, and accessories as shown on the project drawings. The prefabricated or field fabricated assembly shall be field welded to the main PVC geomembrane as shown on the project drawing so as to prevent leakage.
- C. These areas can be welded with any of the methods listed in section 3.04.
- D. All sealed areas shall be Air Lance tested using ASTM D4437 and verified to be leak free.

3.06 Field Quality Control

The Owner's Representative shall be notified prior to all pre-qualification and production welding and testing, or as agreed upon in the pre-construction meeting.

A. Prequalification Test Seams

1. Test seams shall be prepared and tested by the Geomembrane Installer to verify that the seaming parameters are adequate.
2. Test seams shall be made in accordance with ASTM D 4437 by each welding technician at the beginning of each seaming period. Test seaming shall be conducted under the same conditions and with the same equipment and operator as production seaming. The test seams shall be approximately 5' long for all types of field welds.
3. Samples shall be tested and evaluated in accordance with the PGI 1104 Specification in Section 5.01. It should be noted that conditioning of samples and appropriate temperature and humidity requirements must be met to allow for proper testing of the PVC geomembrane.
4. If there is no area on site to provide for these requirements, seam strength can be verified for production using trial welds sent to an independent lab to verify quality.
5. For peel and shear testing see Destructive Field Seam Testing Section 3.06(C) of this document. Field peel and shear strength values should meet the requirements of PGI-1104.
6. If a test seam fails, an additional test seam shall be immediately completed. If the additional test seam fails, the seaming apparatus shall be rejected and not used until the deficiencies are corrected and a successful full test seam can be produced.
7. Each test seam shall be labeled with date, geomembrane temperature, number of seaming unit, panel identification, seam number or test location, technician performing the test seam and a pass or fail description.

B. Non-Destructive Field Seam Testing

1. All field seams shall be non-destructively tested by the Geomembrane Installer over the full length of the seams before the seams are covered. Each seam shall be numbered or otherwise designated. The location, date, test unit, name of QC person, and outcome of all non-destructive shall be recorded and submitted to the Owner's Representative.

2. Testing should be performed as the seaming progresses, not at the completion of all field seaming, unless agreed to in advance by the Owner's Representative. All defects found should be repaired, re-tested and remarked to indicate acceptable completion of repair.
3. Non-destructive testing shall be performed using either the air lance test method (ASTM D4437) or air-channel pressure test method (ASTM D7177).

4. Air Lance Testing

- a. Chemical and solid thermal, i.e., single track, welds can be tested utilizing the Air Lance Test Method ASTM D 4437.. The Geomembrane Installer shall provide an air compressor, air hose, and air lance wand with a pressure gauge capable of measuring the air flow at the tip. The testing shall be performed by experienced technicians familiar with this testing procedure.
- b. This non-destructive test involves placing the air lance wand ¼" to ½", but not more than 2", from the edge of the completed seam and closely monitoring the backside of the sheet for any air penetration through the seam, loose edges, ripples, and/or noise . If air penetrates the seam area, the technician will either see this visibly or hear it audibly.
- c. All seams tested by the air lance method shall be marked with the date tested, name of the technician, length of the seam, and test results. As with all QC work this should be documented on all QC paperwork and preferably witnessed by the Owners Representative or his designated employee.

5. Air Channel Testing

- a. Dual track thermal seams with an enclosed air channel shall be pressure tested by the Geomembrane Installer in accordance with ASTM D7177.
- b. Equipment for testing dual track thermal seams shall be comprised of but not limited to: an air pump equipped with a pressure gauge capable of generating and sustaining a pressure of 420 kPa (60 psi), mounted on a cushion to protect the geomembrane; and a manometer equipped with an approved pressure feed device.
- c. The testing activities shall be performed by the geomembrane installer. Both ends of the seam to be tested shall be sealed and an approved

pressure feed device inserted into the channel created by the dual track thermal weld. The air pump shall be adjusted to a pressure corresponding to the following table from ASTM D1777.

- d. The remainder of the air-channel test procedure is described in ASTM D7177 and should be used.

Sheet Temperature °F	Air Pressure (psi)	Pressure Hold Time
40	60	30 seconds
45	56	30 seconds
50	52	30 seconds
55	47	30 seconds
60	42	30 seconds
65	40	30 seconds
70	36	30 seconds
75	34	30 seconds
80	29	30 seconds
85	27	30 seconds
90	25	30 seconds
95	24	30 seconds
100	22	30 seconds
105	20	30 seconds
110	19	30 seconds

- e. If the air-channel test does not meet the specified pressure for that sheet temperature (see table above), the faulty area shall be located, repaired and retested by the geomembrane installer.
- f. Results of the air pressure testing shall be marked on the seam tested and logged on the air pressure testing record.

6. Vacuum Box Testing

Vacuum Box testing is usually not used on PVC geomembranes because the geomembrane can be pulled up into the vacuum box unless a screen covers the box opening. The vacuum box test procedure is described in ASTM D4437.

C. Destructive Field Seam Testing

1. When Air Lance Testing is performed using ASTM D4437, a minimum of one destructive sample per 500 lineal feet of field seam or at another pre-

determined length should be obtained and tested in accordance with ASTM D6392 by the Geomembrane Installer from a location specified by the Owner's Representative. To obtain test results prior to completion of geomembrane installation, destructive samples shall be cut by the geomembrane installer as directed by the owner's representative as seaming progresses. The Geomembrane Installer shall not be informed in advance of the sample location. When Air Channel Testing is performed, no destructive samples will be taken from the production liner but destructive samples can be obtained from the anchor trench or test welds.

2. All field samples shall be marked with their sample number and seam number. The sample number, date, time, location, and seam number shall be recorded. The geomembrane installer shall repair all holes in the geomembrane resulting from obtaining the samples. All patches shall be repaired and tested using an air lance test. All destructive seam areas shall be patched and tested the same day as the destructive sample.
3. The destructive sample size shall be 300 mm (12" wide by 1m (36") long with the seam centered lengthwise. The sample shall be cut length-wise. The sample shall be cut into three equal sections and distributed as follows; one section given to the owners representative as an archive sample, one section given to the owners representative for laboratory testing as specified in paragraph five (5) of this section, i.e., 3.06(C)(5), and one section given to the geomembrane installer for field testing as specified in paragraph four (4) of this section, i.e., 3.06(C)(4).
4. For field testing of destructive samples, the geomembrane installer shall cut 10 identical 25mm (1 inch) wide replicate specimens from his sample. The geomembrane installer shall test five replicate specimens for seam shear strength and five for peel strength. Peel strength tests will be performed on both the inside and outside of dual track welds. To be acceptable an average of five specimens must pass PGI 1104 specification field seam testing requirements shown in Section 5.01.
5. If independent seam testing is required by the specifications, it shall be conducted in accordance with ASTM D 6214 for chemical seams and ASTM D 6392 for thermal seams by an accredited laboratory who is a member of the PGI.
6. Reports of the results of examinations and testing shall be prepared and submitted to the owner's representative.
7. For field seams, if laboratory tests fail, that shall be considered an indicator of possible inadequacy of the entire seam length corresponding to the test sample. Additional destructive samples of the subject seam

shall be taken by the geomembrane installer at locations indicated by the owner's representative, typically 3 meters (10 feet) on either side of the failed sample and laboratory seam tests shall be performed. Passing tests shall be an indicator of adequate seams. Failing tests shall be an indicator of inadequate seams. All destructive sample locations shall be repaired with a cap strip either thermally or chemically welded into place. All cap stripped seams shall be non-destructively tested with an air lance test.

D. Identification of Defects

1. Panels and seams shall be inspected by the geomembrane installer and the owner's representative during and after panel deployment to identify all defects, including holes, blisters, and undispersed raw materials.
2. Seams shall be inspected by the geomembrane installer and the owner's representative before, during, and after field seaming to identify all dirty and wrinkled areas and any defects.

E. Evaluation of defects: Each suspect location (both in geomembrane seam and non-seam areas) shall be non-destructively tested using the air lance test method in ASTM D4437. Each location which fails non-destructive testing shall be marked, numbered, measured, and posted on the daily installation drawings and subsequently repaired.

1. If a destructive sample fails the field or laboratory tests, the geomembrane installer shall repair the seam between the two nearest passed locations on both sides of the failed destructive sample location.
2. Defective seams, tears, or holes shall be repaired by re-seaming or applying a cap strip.
3. Re-seaming may consist of either:
 - a. Removing the defective area and rewelding the parent material using the original welding equipment, or
 - b. Re-seaming by cap stripping as described in section 3.06(C)(7).
4. Each patch shall extend a minimum of 150 mm (6 inches) in all directions beyond the defect.
5. All repairs shall be measured, located, and recorded.

F. Verification of repairs on seams: Each repair shall be non-destructively tested using the air lance test in ASTM D4437. Tests which pass the non-

destructive test shall be taken as an indication of a successful repair. Failed tests shall be re-seamed and retested until a passing test result is obtained. The number date, location, technician, and test outcome of each patch shall be recorded.

G. Daily field installation reports: At the beginning of each day's work, the installer shall provide the engineer with daily reports for all work accomplished the previous work day.

Reports shall include the following:

1. Total amount and location of geomembrane placed;
2. Total length and location of seams completed, technician name, and welding unit numbers;
3. Drawings of the previous day's installed geomembrane showing panel numbers, seam numbers, and locations of non-destructive and destructive testing;
4. Results of the pre-qualification test seams;
5. Results of non-destructive testing.
6. Results of destructive testing.
 - a. Destructive test results shall be reported prior to covering the lining or within 48 hours.

3.07 Liner Acceptance

- A. The PVC Geomembrane will be accepted by the Owners Representative when all of the following have been completed:
1. The entire installation is finished or an agreed upon subsection of the installation is finished.
 2. All Installers QC documentation is completed and submitted to the owner.
 3. Verification of the adequacy of all field seams and repairs and associated geomembrane testing is complete.

3.08 Anchor Trench Construction and Backfilling

- A. Construct and line anchor trench as specified on contract drawings.
- B. The anchor trench should be backfilled and compacted by the contractor as approved by the INSPECTOR. Trench backfill material should be placed in loose lifts and compacted.
- C. Care should be taken when backfilling the anchor trench to prevent any damage to the geomembrane or other geosynthetics. At no time will construction equipment come into direct contact with the geomembrane. If damage occurs, it will be repaired, at the backfilling contractor's expense, prior to the completion and backfilling of the anchor trench.

3.09 Covering the Geomembrane

- A. The PVC geomembrane must be covered with a minimum of 12 inches of clean soil, free of sticks, stones larger than ½ inch diameter, rubbish, or any other material which may damage the liner. The cover material should be placed over the liner as soon as practical after the liner is installed.
- B. Care should be taken when covering the liner to prevent any damage to the geomembrane or other geosynthetics. At no time will construction equipment come into direct contact with the geomembrane. If damage occurs, it will be repaired, at the contractor's expense, prior to the completion of geomembrane covering.
- C. Cover soil shall be only placed over the geomembrane from the base of the slope to the top of the slope. Cover soil should never be pushed down the slope.
- D. Cover soil should be “rolled” onto the installed geomembrane and not pushed along the geomembrane which can result in damage and wrinkling of the geomembrane.

3.10 Disposal of scrap materials

- A. On completion of installation, the geomembrane installer shall dispose of all waste and scrap material in a location provided and approved by the owner. The installer should also remove all equipment used in connection with the work herein, and shall leave the premises in a neat acceptable manner. No scrap material shall be left on the completed surface of the PVC geomembrane.

4.01 Measurement and Payment

As per project specification or contract.

5.01 PGI 1104 Specification

Specification is also available at www.pvcgeomembrane.com. This material specification has also been adopted by the American Society for Testing and Materials (ASTM) and is listed as ASTM D7176.

PGI 1104 Specification¹

Hydrostatic Resistance	D-751⁴ Min	42 psi 290 kPa	68 psi 470 kPa	100 psi 690 kPa	120 psi 830 kPa	150 psi 1030 kPa	180 psi 1240 kPa
Seam Strengths	ASTM	PVC 10	PVC 20	PVC 30	PVC 40	PVC 50	PVC 60
Shear Strength ³	D-882⁴ Min	20 lbs/in 3.47 kN/m	38.4 lbs/in 6.7 kN/m	58.4 lbs/in 10 kN/m	77.6 lbs/in 14 kN/m	96 lbs/in 17 kN/m	116 lbs/in 20kN/m
Peel Strength ³	D-882⁴ Min	10 lbs/in 1.8 kN/m	12.5 lbs/in 2.2 kN/m	15 lbs/in 2.6 kN/m	15 lbs/in 2.6 kN/m	15 lbs/in 2.6 kN/m	15 lbs/in 2.6 kN/m

Notes:1. PGI 1104 replaces PGI 1103 Specification effective 1/1/04.

2. Certified properties are tested by lot as specified in [PGI 1104 Appendix A](#).

3. Metric values are converted from US values and are rounded to the available significant digits.

4. Modifications or further details of test are described in [PGI 1104 Appendix B](#).

5. Index properties are tested once per formulation as specified in [PGI 1104 Appendix A](#).
